

## HOW TO USE ONE SPECIFIC KEY WHEN THE STORAGE HAS DIFFERENT KEY FILES WITH THE SAME ALIAS:

1. When you start JSignPDF and load the keys, I find three key files with the same alias.

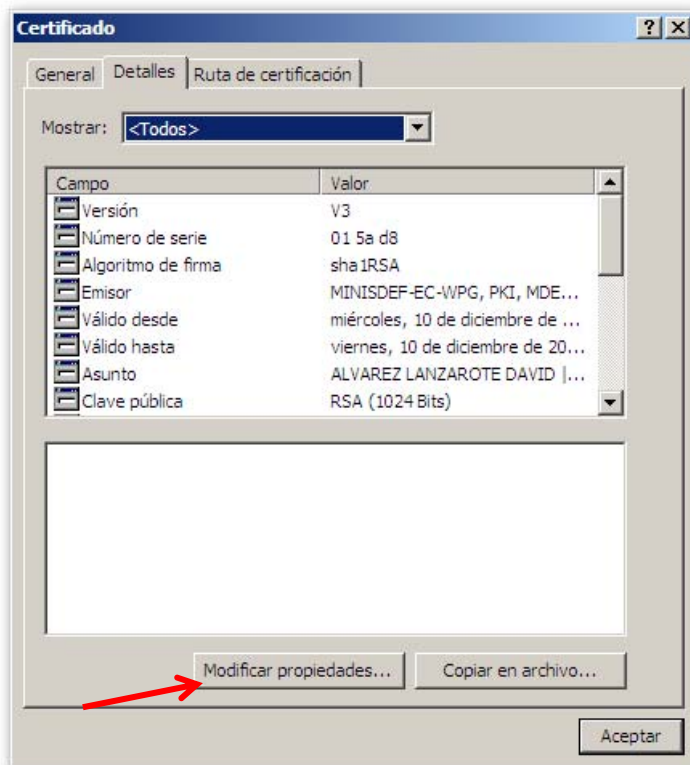

The problem is that only one of them is for digital signature purposes, but it is not the first one. So the digital signature applied to the document is not OK, and Acrobat Reader rejects it.

2. I get the same information if I look for the Certificates in Internet Explorer, in the Internet Options, Content tab sheet:

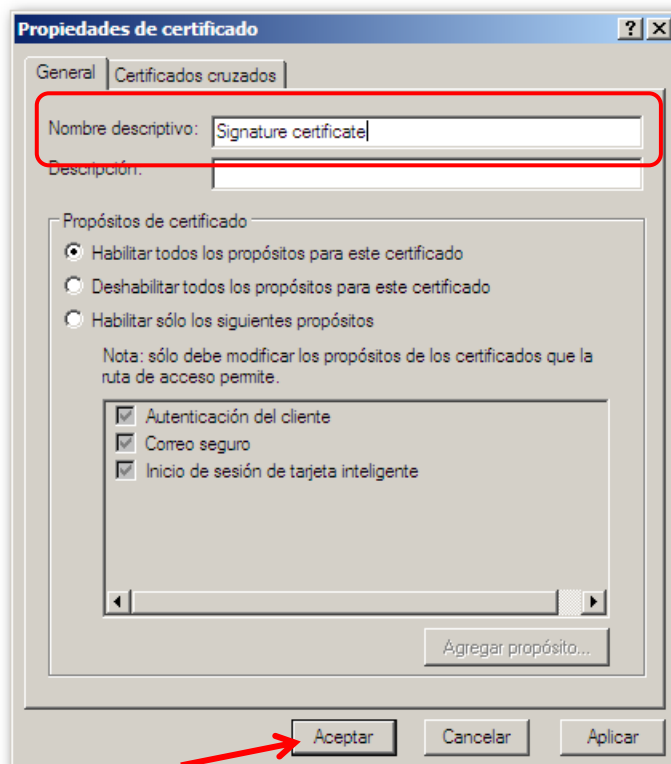

Just the one in the middle is OK for the digital signature process.

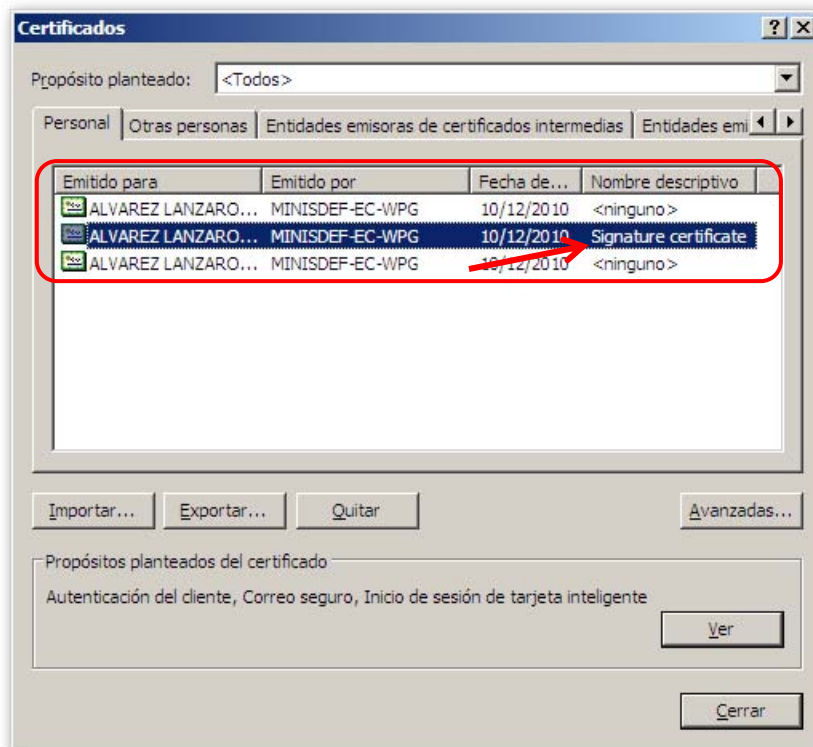

2. The I click on See the Certificate, and then in Details tab sheet. There I click on Modify Certificate... button.

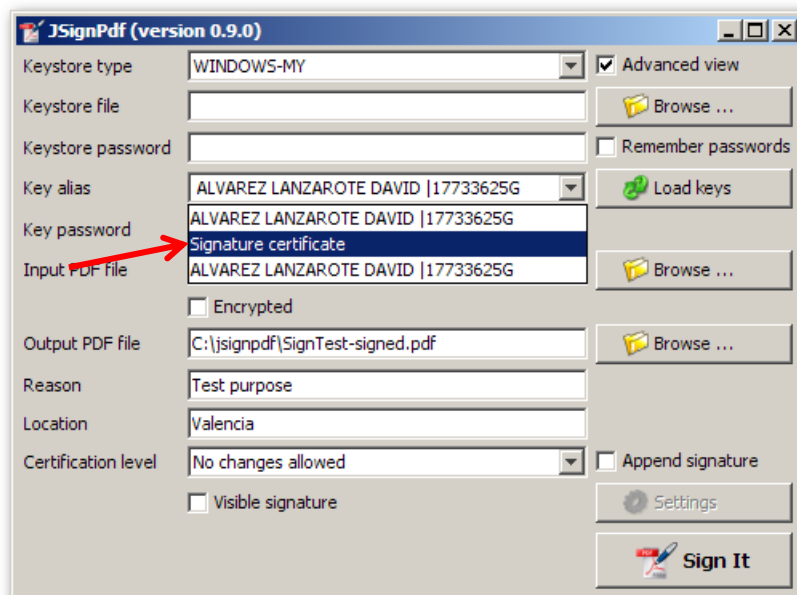

3. A Certificate Properties window opens. Here I can change the Descriptive Name:

4. Then I accept changes and in the Certificates windows, you can see that the Descriptive Name has changed with the value I've written before;

5. The same happens in JSignPDF. Now I can select the right certificate for signing my PDF documents:

And voilà
